

The figure displays four box plots representing the distribution of the variable 'number' across four categories: 'none', 'small', 'big', and 'huge'. The y-axis represents the 'number' values, ranging from 0 to 300. Each box plot includes a median line (orange), a box representing the interquartile range (IQR), whiskers extending to the most extreme data points not considered outliers, and individual points for outliers. The 'none' category (red box) has a median around 100. The 'small' (blue), 'big' (purple), and 'huge' categories have medians around 150, 150, and 250, respectively. All categories show a high density of outliers above the upper whisker, with the 'huge' category having the most outliers, reaching up to 300.
